1. Introduction

1.1. Background Information

Brass Fertilizer and Petrochemical Company Limited (BFPCL) is developing a 10,000 metric tonnes per day (MTPD) capacity greenfield methanol production facility in Akabel (Odioma), Brass LGA, Bayelsa state. The plant complex is to be based on natural gas feedstock from 5 SPDC fields in OMLs 33, 35 & 36.

The Project involves the development, construction, and operation of a plant comprising:

- Two trains of 5,000 MTPD methanol plant, producing a total of 10,000 MTPD of methanol
- 340 MMscfd Gas Processing Plant ("GPP"), which will extract NGL from the natural gas feedstock, prior to feeding the lean gas to the methanol plant.
- Gas gathering pipelines and associated manifolds transporting the natural gas from five fields, viz: Bubouwe Bou (BBOU), Elepa (ELEP), Nun River (NUNR), Seibou (SEIB), and Opubene (OPUG) to the GPP at Akabel.
- Product Export Lines and SBM for the export of the methanol, and NGL of the GPP.
- All offsite, utility, and off-plot facilities (including product storage, internal power generation, steam generation, and export jetty) for the operation of the processing plants.

The Pipelines will be implemented in two phases, - starting with BBOU & ELEP as Phase 1 and followed by NUNR, SEIB & OPUG as Phase 2.

The focus of the present FEED is on Phase 1 as shown in figure 1 below, while Phase 2 will be implemented later.

TCE is the Project Management Consultant for the project.

1.2. Purpose

The objective of this report is to document the simulation results of the gas pipelines from BBOU to Elepa and Elepa to Akabel. It details the line sizing, flow assurance, and gas deliverability to Akabel Gas plant at required pressure.

The FEED shall fully comply with all specified relevant contractual requirements.

3. SIMULATION METHODOLOGY

3.1. Simulation Scope

- i. Generate mass and material balances for flow sources in-situ the pipelines and at the delivery outlets.
- ii. Establish appropriate line sizes suitable for the anticipated peak flow from the fields.
- iii. Flow assurance (parameter checks; which includes pressure, temperature, velocity and hydrate formation).
- iv. Develop a suitable operating flow conditions (pressure and temperature).

3.2. Simulation Basis and Assumptions

3.2.1. Base Assumption

The pipeline temperature ambient medium was taken as 25 OC. Also, it is assumed for this conceptual study, that there are no elevation changes across the pipeline route.

3.2.2. Software

The hydraulics process simulation study was undertaken using Aspen Hysys v7.3.

Water saturation extension was explored to determine the saturated water in the gas.

3.2.3. Simulation Property Package

The thermodynamic equation of state (EOS) used for the process simulation is; Peng-Robinson (PR) fluid property package.

3.3. Well Fluid Simulation

The composition of the well fluids were simulated using the following conditions:

- v. Dry gas composition at each Well
- vi. Reservoir pressure and temperature conditions at each Well
- vii. Estimated flow at from each Well

3.3.1. Dry gas composition at each Well

The gas composition for each field was culled from the Basis of Design Document, EA-BFPCL-GPMC-GGPL-FEED-GEN-RPT-002-R02. Each of the well fluid composition was assumed to be given on a "dry basis", therefore they were saturated with water before free water and condensate are added in order to arrive at a mixed fluid flow that was used in the simulation of the manifolds and pipelines.

The flashed gas and liquid composition are presented below:

The Peng Robinson EOS was selected for the VLE calculations because it is the generally recommended model For Oil, Gas, or Petrochemical applications. The PR property package rigorously solves any single-, two-, or three-phase system with a high degree of efficiency and reliability and is applicable over a wide range of conditions:

- Temperature Range > -271 °C or -456 °F
- Pressure Range < 100,000 kPa or 15,000 psia

The well fluids compositions fall within these range.

3.3.2. Reservoir pressure and temperature conditions at each Well

The table below shows the reservoir pressure and temperature used for each Well.

3.3.3. Flow Simulation

The two Pipelines (BBOU-to-Elepa and Elepa-to-Akabel) were simulated using the maximum combined flow of gas, condensate and water that will be handled by each of the Pipeline – BBOU and Elepa.

BBOU Manifold. This is a very conservative assumptions made since the actual forecast are not available at the time of preparing this report.

3.3.4. Selected Flow for BBOU-to-Elepa Pipeline

The maximum flow used for gas, condensate and water for the BBOU-to-Elepa Pipeline occurred in Years 9, 18 and 7 respectively as highlighted in the table below. Maximum combined flow are 331 MMSCFD gas, 16226 bpd of condensate and 9002 bpd of water.

4. Simulation Results

For phase-1 gas production, Two (2) scenarios were explored for each pipeline:

4.1. Scenario Definitions

4.1.1. BBOU-Elepa Pipeline

- Scenario-1 is minimum supply pressure of 80 barg by SPDC at BBOU Manifold
- Scenario-2 is maximum supply pressure of 100 barg by SPDC at BBOU Manifold

4.1.2. Elepa-Akabel Pipeline

- Scenario-3 is minimum supply pressure of 80 barg by SPDC at Elepa Manifold
- Scenario-4 is maximum supply pressure of 100 barg by SPDC at Elepa Manifold

4.2. Phase-1/Scenario-1 Gas Production

This scenario shows the deliverability of maximum flow of gas, condensate and water from both BBOU and Opugbene Fields to the 24 inch BBOU-Elepa Pipeline when supply pressure at BBOU Manifold is 80 barg. The maximum flows occur in Years 9, 18 and 7 respectively as shown in the production forecast. Maximum combined flows are 331 MMSCFD gas, 16226 bpd of condensate and 9002 bpd of water.

4.2.1. Pressure and Temperature Regime

Source Conditions at the CTP; 100 barg pressure and corresponding temperature of 62.14 °C. Cumulative molar flow of gas, condensate and water at this condition is 346 MMSCFD.

Delivery Pressure; at ELEP E-MF is 97.49 bar and the corresponding temperature is 58.10 °C.

The Line Size; which also supported 346 MMscfd cumulative molar flow of gas, condensate and water of gas flow across the 6.7 km BBOU-ELEP E-MF bulk-line with minimal pressure loss and with a velocity below erosional velocity mark is 24". And the pressure drop is 0.44 bar/km.

See Appendix 1 for detailed simulation results for more details

5. Conclusion

Pressure deliverability:

All scenarios studied gives satisfactory results that guarantees flow assurance and gas deliverability at required 60 – 65 barg pressure required at Akabel for gas plant operations.

Pipeline Velocity:

Notably, at the declined stage of the fields when low volume flow sets-in, the prevailing fluid velocity is below minimum velocity required to sweep the pipe clean.

Line Sizes:

All the line were sized to flow at velocities below erosional velocity and also, to achieve a minimal pressure losses. This criterion guarantees that, the pipeline wall will not be eroded and also ensures adequate pressure deliverability.

Hydrate Formation:

For the entire pipeline examined; at the flow conditions (pressure & temperature regimes) no indication that hydrates will be formed on the lines.
